

Virtual Private Networks

Internet based virtual private networks, or VPN's, let you turn the Internet into your corporate network. What this does for your company is allow users anywhere in the world secure access via a dial-up Internet connection, or preferably a high speed connection (T1, DSL etc.) Through the use of encryption, VPN connections are protected from outside users, safeguarding data and allowing the secure, remote use of important applications.

This can mean a fairly substantial savings over traditional leased-line or dial-up connections. Users can expect to save hundreds of dollars a month in some cases, on dedicated Internet access connections when compared to dedicated private lines from a long-distance provider.

With the implementation of a VPN by Health Data Systems, you can expect:

- Cost savings
- Worldwide access
- Email access
- Internet access
- Greater access speed
- Password & data encryption

HDSI has designed and implemented VPN's for several of our customers. If you're looking for a way to reduce monthly communication charges, increase points of access, while maintaining the security you have now at higher access speeds, then a VPN is what your looking for.

Contact HDSI today, at (847)398-0000, and see what benefits can be found taking advantage of today's technology.

VPN: Networks deployed on a public network infrastructure that employ the same security, management, and quality of service applied in a private network.
